Technologie de l'information et la communication

$$8 \text{ bits} = 1 \text{ octe}$$

$$1 \text{ Ko} = 1024 \text{ octe} = 2^{10} \text{ octe}$$

$$1 \text{ Mo} = 2^{10} \text{ Ko}$$

$$1 \text{ Go} = 2^{10} \text{ Mo}$$

$$1 \text{ To} = 2^{10} \text{ Go}$$

Exemple :

$$64 \text{ bits} = 8 \text{ octes}$$

$$2^{20} \text{ Ko} = 2^{10} \times 2^{10} \text{ octes} = 2^{30} \text{ octes}$$

$$8 \cdot 2^{11} \text{ bits} = 8 \cdot 2^{11} / 8 \cdot 2^{10} \text{ Ko} = 2 \text{ Ko}$$

$$2^{-30} \text{ Go} = 2^{-30} \times 2^{30} = 1 \text{ octe}$$

Donc :

$$x \text{ octe} \longrightarrow y \text{ Ko}$$

$$y = x / 2^{10}$$

$$y \text{ Ko} \longrightarrow x \text{ octe}$$

$$x = y \times 2^{10}$$
